VORKMAN NYDE

ABSTRACT OF THE DISCLOSURE

A base station including a transmitting and receiving amplifier for amplifying

CDMA signals exchanged with a mobile station; a radio stage connected to the

transmitting and receiving amplifier for carrying out D/A conversion of a transmitted

signal that undergoes baseband spreading, followed by quadrature modulation, and for

carrying out quasi-coherent detection of a received signal, followed by A/D conversion;

a baseband signal processor connected with the radio stage for carrying out baseband

signal processing of the transmitted signal and the received signal; a transmission

interface connected with the baseband signal processor for implementing interface with

external channels; and a base station controller for carrying out control such as

management of radio channels and establishment and release of the radio channels. The

base station communicates with the external channels by mapping logical channels into

physical channels. The CDMA signals are spread using a short code and a long code.
